Ridesharing that explains itself.

NAIROBI PILOT · PRE-SEED

MISSION

RideShare Genesis is a human-centred, technology-enabled mobility platform designed to help people identify and fulfil real mobility needs through shared journeys, intelligent assistance, trust infrastructure, and measurable impact.

ELEVEN TECHNOLOGY LAYERS, NOT ONE FEATURE

Nine of these are live in production today; mapping/routing (a placeholder geocoder for now) and predictive "future mobility intelligence" are in progress — named honestly, not glossed over.

Real-time journey marketplace

Data infrastructure

Future mobility intelligence

THE PROBLEM

Ride-matching is a black box everywhere — riders can't see why they were paired with a given driver, and drivers face opaque commission structures they can't audit. In markets where ridesharing is still informal — Nairobi's matatu culture included — trust has to be earned trip by trip, not assumed.

THE SOLUTION

Every match explains itself.

- **Decision DNA** — a live, weighted score across six factors (route fit, timing, price, preferences, reliability, and environmental fit) shown to the rider, not hidden — and personally retunable.
- **Verified Driver review** — licence, vehicle registration, and insurance checked before a driver can post, honestly labelled for what it does and doesn't yet certify.
- **Mobile-money-native** — M-Pesa and card payments live from day one, a shillings-first product, not a card-first one retrofitted for Kenya.

TRACTION

- **V1 is fully built and live in production at** [ridesharegenesis.app](#) — real M-Pesa & card payments, a working matching engine, a Safety Centre, driver verification. Deliberately pre-launch on user acquisition: commission plumbing is live end-to-end at 0% while we seed the first cohort. This round funds the go-to-market push that hasn't started yet.

WHY NAIROBI, THEN WHERE NEXT

Mobile-money-native payments and an informal matatu-based trust gap
Decision DNA closes faster than a black-box score. The same criteria point regionally once the pilot proves out:

Nairobi (pilot)

Kampala

Dar es Salaam

Kigali

MARKET — SIZED BOTTOM-UP

\$750M

TAM — East African urban ride-hailing & carpooling / yr

\$150M

SAM — Nairobi metro shared-ride spend / yr

\$3M

SOM — Year-3 Nairobi pilot target GMV / yr

UNIT ECONOMICS

KES 650 avg fare · **10% target take rate** ≈ \$0.50 revenue/ride — already live end-to-end, since every payment stores its own rate at the moment it's captured, so history never gets rewritten.

YEAR-3 TARGET

~5,700 monthly active riders — 2% penetration of the Nairobi SAM, ≈8 rides/rider/month. The milestone this round is sized to reach, not a hockey-stick guess.

WHAT'S HONESTLY STILL OPEN

Kenyan business registration, carpooling-vs-e-hailing legal classification, and contingent liability insurance beyond a driver's own policy are not yet resolved — named plainly here, not discovered in diligence.

THE ASK

\$250,000

Pre-seed · 12-month runway

- **Real geocoding & maps** to replace the current placeholder layer
- **Driver ID verification** — Tier 2 automated checks against licensing-authority data
- **A licensed payment processor** at production volume, beyond the current integration
- **First 5,000-rider Nairobi cohort** — the go-to-market push, not product build

LET'S TALK

Happy to walk through the live product, the Decision DNA scoring logic, or the numbers behind this summary — whichever gets you to a decision fastest. The app is live today; create a real account and try a ride as a rider or driver.
